

ABSTRACT

The present invention provides an improved side-sealed bag comprising an open, mesh-like fabric and a label section.

- 5 The bag has a closed end formed by a fold in the fabric, an opposing end and longitudinal, heat-sealed side seams extending from the closed end to the opposing end. The bags are used for packaging articles for which visibility and/or breathability of the bag fabric are useful characteristics.
- 10 In a preferred embodiment, the bags are also suited for manufacture and filling using high speed, automated equipment.
